

# Package ‘mSigHdp’

June 9, 2020

**Title** Mutational signature extraction using hdp (Hierarchical Dirichlet Process)

**Version** 0.0.0.9017

**Description** Calls hdp for mutational signature analysis, with performance issues in hdp::stirling() corrected.

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**Language** en-US

**biocViews**

**Imports** hdpx (>= 0.1.5.0014),  
SynSigGen

**Roxygen** list(markdown = TRUE)

**Depends** R (>= 3.5)

**RoxygenNote** 7.1.0

**Remotes** github::steverozen/hdpx,  
github::steverozen/SynSigGen,  
github::WuyangFF95/SynSigEval

**Suggests** testthat,  
ICAMS,  
utils,  
SynSigEval

`AnalyzeAndPlotretval`*Evaluate and plot retval from CombinePosteriorChains*

---

**Description**

Evaluate and plot retval from CombinePosteriorChains

**Usage**

```
AnalyzeAndPlotretval(  
  retval,  
  out.dir = NULL,  
  ground.truth.sig = NULL,  
  ground.truth.exp = NULL,  
  verbose = TRUE,  
  overwrite = TRUE  
)
```

**Arguments**

<code>retval</code>	the output from function <code>CombinePosteriorChains</code>
<code>out.dir</code>	Directory that will be created for the output; if <code>overwrite</code> is <code>FALSE</code> then abort if <code>out.dir</code> already exists.
<code>ground.truth.sig</code>	Optional. Either a string with the path to file with ground truth signatures or and <a href="#">ICAMS</a> catalog with the ground truth signatures. These are the signatures used to construct the ground truth spectra.
<code>ground.truth.exp</code>	Optional. Ground truth exposure matrix or path to file with ground truth exposures. If <code>NULL</code> skip checks that need this information.
<code>verbose</code>	If <code>TRUE</code> then message progress information.
<code>overwrite</code>	If <code>TRUE</code> overwrite <code>out.dir</code> if it exists, otherwise raise an error.

---

`BurninIteration`*Run hdp extraction and attribution on a spectra catalog file A function to do burn-in iteration only. This returns a list of hdp object. This needs to be converted to a hdpState object before hdp\_posterior (hdp:::as.hdpState(hdplist))*

---

**Description**

Run hdp extraction and attribution on a spectra catalog file A function to do burn-in iteration only. This returns a list of hdp object. This needs to be converted to a hdpState object before hdp\_posterior (hdp:::as.hdpState(hdplist))

**Usage**

```
BurninIteration(
  input.catalog,
  seedNumber = 1,
  K.guess,
  multi.types = FALSE,
  verbose = TRUE,
  post.burnin = 4000,
  post.cpiter = 3,
  post.verbosity = 0,
  gamma.alpha = 1,
  gamma.beta = 1
)
```

**Arguments**

<code>input.catalog</code>	Input spectra catalog as a matrix or in <a href="#">ICAMS</a> format.
<code>seedNumber</code>	An integer that is used to generate separate random seeds for each call to <a href="#">dp_activate</a> , and each call of <a href="#">hdp_posterior</a> ; please see the code on how this is done. But repeated calls with same value of <code>seedNumber</code> and other inputs should produce the same results.
<code>K.guess</code>	Suggested initial value of the number of signatures, passed to <a href="#">dp_activate</a> as <code>initcc</code> .
<code>multi.types</code>	A logical scalar or a character vector. If <code>FALSE</code> , The HDP analysis will regard all input spectra as one tumor type. If <code>TRUE</code> , the HDP analysis will infer tumor types based on the string before "::" in their names. e.g. tumor type for "SA.Syn.Ovary-AdenoCA::S.500" would be "SA.Syn.Ovary-AdenoCA" If <code>multi.types</code> is a character vector, then it should be of the same length as the number of columns in <code>input.catalog</code> , and each value is the name of the tumor type of the corresponding column in <code>input.catalog</code> . e.g. <code>c("SA.Syn.Ovary-AdenoCA", "SA.Syn.Kidney-RCC")</code> .
<code>verbose</code>	If <code>TRUE</code> then message progress information.
<code>post.burnin</code>	Pass to <a href="#">hdp_posterior</a> burnin.
<code>post.cpiter</code>	Pass to <a href="#">hdp_posterior</a> cpiter.
<code>post.verbosity</code>	Pass to <a href="#">hdp_posterior</a> verbosity.
<code>gamma.alpha</code>	Shape parameter of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.
<code>gamma.beta</code>	Inverse scale parameter (rate parameter) of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.

**Value**

A list with `hdp` object after burn-in iteration and likelihood of iteration

---

ChainsDiagnosticPlot

*Diagnostic plot for a hdpSampleMulti object*

---

## Description

Diagnostic plot for a hdpSampleMulti object

## Usage

```
ChainsDiagnosticPlot(retval, out.dir, verbose)
```

## Arguments

retval	output from CombinePosteriorChains. A list with the following elements: <b>signature</b> The extracted signature profiles as a matrix; rows are mutation types, columns are samples (e.g. tumors). <b>exposure</b> The inferred exposures as a matrix of mutation counts; rows are signatures, columns are samples (e.g. tumors). <b>multi.chains</b> A <code>hdpSampleMulti-class</code> object. This object has the method <code>chains</code> which returns a list of <code>hdpSampleChain-class</code> objects. Each of these sample chains objects has a method <code>final_hdpState</code> (actually the methods seems to be just <code>hdp</code> ) that returns the <code>hdpState</code> from which it was generated.
out.dir	Directory that will be created for the output; if <code>overwrite</code> is <code>FALSE</code> then abort if <code>out.dir</code> already exists.
verbose	If <code>TRUE</code> then message progress information.

---

CleanChlist

*If the job of Gibbs sampling from MultipleSetupAndPosterior has an error caught by R, the corresponding element of chlist has class try-error. If the job is stopped with, e.g. a segfault, the chlist element is NULL.*

---

## Description

If the job of Gibbs sampling from `MultipleSetupAndPosterior` has an error caught by R, the corresponding element of `chlist` has class `try-error`. If the job is stopped with, e.g. a segfault, the `chlist` element is `NULL`.

## Usage

```
CleanChlist(chlist, verbose = FALSE)
```

## Arguments

chlist	A list of <code>hdpSampleChain-class</code> objects.
--------	--

## Value

Invisibly, the clean, non-error `chlist` This is a list of `hdpSampleChain-class` objects.

---

CombinePosteriorChains

*Extract components and exposures from multiple posterior sample chains*

---

## Description

Extract components and exposures from multiple posterior sample chains

## Usage

```
CombinePosteriorChains (
  clean.chlist,
  input.catalog,
  multi.types,
  verbose = TRUE,
  cos.merge = 0.9,
  min.sample = 1
)
```

## Arguments

<code>clean.chlist</code>	It collects the output of multiple independent <code>hdp_posterior</code> calls.
<code>input.catalog</code>	Input spectra catalog as a matrix or in <a href="#">ICAMS</a> format.
<code>multi.types</code>	<p>A logical scalar or a character vector. If <code>FALSE</code>, The HDP analysis will regard all input spectra as one tumor type.</p> <p>If <code>TRUE</code>, the HDP analysis will infer tumor types based on the string before "::" in their names. e.g. tumor type for "SA.Syn.Ovary-AdenoCA::S.500" would be "SA.Syn.Ovary-AdenoCA"</p> <p>If <code>multi.types</code> is a character vector, then it should be of the same length as the number of columns in <code>input.catalog</code>, and each value is the name of the tumor type of the corresponding column in <code>input.catalog</code>.</p> <p>e.g. <code>c("SA.Syn.Ovary-AdenoCA", "SA.Syn.Kidney-RCC")</code>.</p>
<code>verbose</code>	If <code>TRUE</code> then message progress information.
<code>cos.merge</code>	The cosine similarity threshold for merging raw clusters from the posterior sampling chains into "components" i.e. signatures; passed to <a href="#">hdp_extract_components</a> .
<code>min.sample</code>	A "component" (i.e. signature) must have at least this many samples; passed to <a href="#">hdp_extract_components</a> .

## Value

Invisibly, a list with the following elements:

**signature** The extracted signature profiles as a matrix; rows are mutation types, columns are samples (e.g. tumors).

**exposure** The inferred exposures as a matrix of mutation counts; rows are signatures, columns are samples (e.g. tumors).

**multi.chains** A `hdpSampleMulti-class` object. This object has the method `chains` which returns a list of `hdpSampleChain-class` objects. Each of these sample chains objects has a method `final_hdpState` (actually the methods seems to be just `hdp`) that returns the `hdpState` from which it was generated.

---

MultipleSetupAndPosterior

*Activate hierarchical Dirichlet processes and run posterior sampling in parallel.*

---

## Description

Activate hierarchical Dirichlet processes and run posterior sampling in parallel.

## Usage

```
MultipleSetupAndPosterior(
  input.catalog,
  seedNumber = 1,
  K.guess,
  multi.types = FALSE,
  verbose = TRUE,
  post.burnin = 4000,
  post.n = 50,
  post.space = 50,
  post.cpiter = 3,
  post.verbosity = 0,
  CPU.cores = 1,
  num.child.process = 4,
  gamma.alpha = 1,
  gamma.beta = 1
)
```

## Arguments

<code>input.catalog</code>	Input spectra catalog as a matrix or in <a href="#">ICAMS</a> format.
<code>seedNumber</code>	A random seeds passed to <a href="#">dp_activate</a> .
<code>K.guess</code>	Suggested initial value of the number of signatures, passed to <a href="#">dp_activate</a> as <code>initcc</code> .
<code>multi.types</code>	<p>A logical scalar or a character vector. If <code>FALSE</code>, The HDP analysis will regard all input spectra as one tumor type.</p> <p>If <code>TRUE</code>, the HDP analysis will infer tumor types based on the string before "::" in their names. e.g. tumor type for "SA.Syn.Ovary-AdenoCA::S.500" would be "SA.Syn.Ovary-AdenoCA"</p> <p>If <code>multi.types</code> is a character vector, then it should be of the same length as the number of columns in <code>input.catalog</code>, and each value is the name of the tumor type of the corresponding column in <code>input.catalog</code>. e.g. <code>c("SA.Syn.Ovary-AdenoCA", "SA.Syn.Kidney-RCC")</code>.</p>
<code>verbose</code>	If <code>TRUE</code> then message progress information.

<code>post.burnin</code>	Pass to <code>hdp_posterior</code> <code>burnin</code> .
<code>post.n</code>	Pass to <code>hdp_posterior</code> <code>n</code> .
<code>post.space</code>	Pass to <code>hdp_posterior</code> <code>space</code> .
<code>post.cpiter</code>	Pass to <code>hdp_posterior</code> <code>cpiter</code> .
<code>post.verbosity</code>	Pass to <code>hdp_posterior</code> <code>verbosity</code> .
<code>CPU.cores</code>	Number of CPUs to use; there is no point in making this larger than <code>num.child.process</code> .
<code>num.child.process</code>	Number of posterior sampling chains; can set to 1 for testing.
<code>gamma.alpha</code>	Shape parameter of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.
<code>gamma.beta</code>	Inverse scale parameter (rate parameter) of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.

**Value**

Invisibly, the clean `chlist` (output of `CleanChlist`). This is a list of `hdpSampleChain-class` objects.

---

PlotExposure	<i>Plot a single exposure plot</i>
--------------	------------------------------------

---

**Description**

Plot a single exposure plot

**Usage**

```
PlotExposure(exposures, plot.proportion = FALSE, plot.legend = TRUE, ...)
```

**Arguments**

<code>exposures</code>	Exposures as a numerical matrix (or <code>data.frame</code> ) with signatures in rows and samples in columns. Rownames are taken as the signature names and column names are taken as the sample IDs. If you want <code>exp</code> sorted from largest to smallest use <code>SortExp</code> . Do not use column names that start with multiple underscores. The exposures will often be mutation counts, but could also be e.g. mutations per megabase.
<code>plot.proportion</code>	Plot exposure proportions rather than counts.
<code>plot.legend</code>	If TRUE plot a legend.
<code>...</code>	Parameters passed to <code>barplot</code> .

---

PlotExposureByRange

*Plot exposures in multiple plots each with a manageable number of samples.*

---

### Description

Plot exposures in multiple plots each with a manageable number of samples.

### Usage

```
PlotExposureByRange(exposures, num.per.line = 30, plot.proportion = FALSE, ...)
```

### Arguments

<code>exposures</code>	Exposures as a numerical matrix (or data.frame) with signatures in rows and samples in columns. Rownames are taken as the signature names and column names are taken as the sample IDs. If you want <code>exposures</code> sorted from largest to smallest use <a href="#">SortExp</a> . Do not use column names that start with multiple underscores. The exposures will often be mutation counts, but could also be e.g. mutations per megabase.
<code>num.per.line</code>	Number of samples to show in each plot.
<code>plot.proportion</code>	Plot exposure proportions rather than counts.
<code>...</code>	Other arguments passed to <a href="#">PlotExposure</a> . If <code>ylab</code> is not included, it defaults to a value depending on <code>plot.proportion</code> . If <code>col</code> is not supplied the function tries to do something reasonable.

---

PrepInit

*Initialize hdp object Allocate process index for hdp initialization. Prepare for [hdp\\_init](#)*

---

### Description

Initialize hdp object Allocate process index for hdp initialization. Prepare for [hdp\\_init](#)

### Usage

```
PrepInit(
  multi.types,
  input.catalog,
  verbose,
  K.guess,
  gamma.alpha = 1,
  gamma.beta = 1
)
```

**Arguments**

<code>multi.types</code>	<p>A logical scalar or a character vector. If <code>FALSE</code>, The HDP analysis will regard all input spectra as one tumor type.</p> <p>If <code>TRUE</code>, the HDP analysis will infer tumor types based on the string before ":" in their names. e.g. tumor type for "SA.Syn.Ovary-AdenoCA::S.500" would be "SA.Syn.Ovary-AdenoCA"</p> <p>If <code>multi.types</code> is a character vector, then it should be of the same length as the number of columns in <code>input.catalog</code>, and each value is the name of the tumor type of the corresponding column in <code>input.catalog</code>. e.g. <code>c("SA.Syn.Ovary-AdenoCA", "SA.Syn.Kidney-RCC")</code>.</p>
<code>input.catalog</code>	Input spectra catalog as a matrix or in <a href="#">ICAMS</a> format.
<code>verbose</code>	If <code>TRUE</code> then message progress information.
<code>K.guess</code>	Suggested initial value of the number of signatures, passed to <a href="#">dp_activate</a> as <code>initcc</code> .
<code>gamma.alpha</code>	Shape parameter of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.
<code>gamma.beta</code>	Inverse scale parameter (rate parameter) of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.

---

<code>RunHdpParallel</code>	<i>Extract mutational signatures and optionally compare them to existing signatures and exposures.</i>
-----------------------------	--

---

**Description**

Extract mutational signatures and optionally compare them to existing signatures and exposures.

**Usage**

```
RunHdpParallel(
  input.catalog,
  seedNumber = 1,
  K.guess,
  multi.types = FALSE,
  verbose = TRUE,
  post.burnin = 4000,
  post.n = 50,
  post.space = 50,
  post.cpiter = 3,
  post.verbosity = 0,
  CPU.cores = 1,
  num.child.process = 4,
  cos.merge = 0.9,
  min.sample = 1,
  ground.truth.sig = NULL,
```

```

ground.truth.exp = NULL,
overwrite = TRUE,
out.dir = NULL,
gamma.alpha = 1,
gamma.beta = 1
)

```

## Arguments

<code>input.catalog</code>	Input spectra catalog as a matrix or in <a href="#">ICAMS</a> format.
<code>seedNumber</code>	A random seeds passed to <a href="#">dp_activate</a> .
<code>K.guess</code>	Suggested initial value of the number of signatures, passed to <a href="#">dp_activate</a> as <code>initcc</code> .
<code>multi.types</code>	<p>A logical scalar or a character vector. If <code>FALSE</code>, The HDP analysis will regard all input spectra as one tumor type.</p> <p>If <code>TRUE</code>, the HDP analysis will infer tumor types based on the string before ":" in their names. e.g. tumor type for "SA.Syn.Ovary-AdenoCA::S.500" would be "SA.Syn.Ovary-AdenoCA"</p> <p>If <code>multi.types</code> is a character vector, then it should be of the same length as the number of columns in <code>input.catalog</code>, and each value is the name of the tumor type of the corresponding column in <code>input.catalog</code>. e.g. <code>c("SA.Syn.Ovary-AdenoCA", "SA.Syn.Kidney-RCC")</code>.</p>
<code>verbose</code>	If <code>TRUE</code> then message progress information.
<code>post.burnin</code>	Pass to <a href="#">hdp_posterior</a> burnin.
<code>post.n</code>	Pass to <a href="#">hdp_posterior</a> n.
<code>post.space</code>	Pass to <a href="#">hdp_posterior</a> space.
<code>post.cpiter</code>	Pass to <a href="#">hdp_posterior</a> cpiter.
<code>post.verbosity</code>	Pass to <a href="#">hdp_posterior</a> verbosity.
<code>CPU.cores</code>	Number of CPUs to use; there is no point in making this larger than <code>num.child.process</code> .
<code>num.child.process</code>	Number of posterior sampling chains; can set to 1 for testing.
<code>cos.merge</code>	The cosine similarity threshold for merging raw clusters from the posterior sampling chains into "components" i.e. signatures; passed to <a href="#">hdp_extract_components</a> .
<code>min.sample</code>	A "component" (i.e. signature) must have at least this many samples; passed to <a href="#">hdp_extract_components</a> .
<code>ground.truth.sig</code>	Optional. Either a string with the path to file with ground truth signatures or and <a href="#">ICAMS</a> catalog with the ground truth signatures. These are the signatures used to construct the ground truth spectra.
<code>ground.truth.exp</code>	Optional. Ground truth exposure matrix or path to file with ground truth exposures. If <code>NULL</code> skip checks that need this information.
<code>overwrite</code>	If <code>TRUE</code> overwrite <code>out.dir</code> if it exists, otherwise raise an error.
<code>out.dir</code>	Directory that will be created for the output; if <code>overwrite</code> is <code>FALSE</code> then abort if <code>out.dir</code> already exists.

<code>gamma.alpha</code>	Shape parameter of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.
<code>gamma.beta</code>	Inverse scale parameter (rate parameter) of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.

## Value

Invisibly, a list with the following elements:

**signature** The extracted signature profiles as a matrix; rows are mutation types, columns are samples (e.g. tumors).

**exposure** The inferred exposures as a matrix of mutation counts; rows are signatures, columns are samples (e.g. tumors).

**multi.chains** A `hdpSampleMulti-class` object. This object has the method `chains` which returns a list of `hdpSampleChain-class` objects. Each of these sample chains objects has a method `final_hdpState` (actually the methods seems to be just `hdp`) that returns the `hdpState` from which it was generated.

---

SetupAndActivate	<i>Generate an HDP Gibbs sampling chain from a spectra catalog.</i>
------------------	---

---

## Description

Generate an HDP Gibbs sampling chain from a spectra catalog.

## Usage

```
SetupAndActivate(
  input.catalog,
  seedNumber = 1,
  K.guess,
  multi.types = FALSE,
  verbose = TRUE,
  gamma.alpha = 1,
  gamma.beta = 1
)
```

## Arguments

<code>input.catalog</code>	Input spectra catalog as a matrix or in <a href="#">ICAMS</a> format.
<code>seedNumber</code>	A random seeds passed to <a href="#">dp_activate</a> .
<code>K.guess</code>	Suggested initial value of the number of signatures, passed to <a href="#">dp_activate</a> as <code>initcc</code> .

<code>multi.types</code>	<p>A logical scalar or a character vector. If <code>FALSE</code>, The HDP analysis will regard all input spectra as one tumor type.</p> <p>If <code>TRUE</code>, the HDP analysis will infer tumor types based on the string before "::&lt;" in their names. e.g. tumor type for "SA.Syn.Ovary-AdenoCA::<s.500" "sa.syn.ovary-adenoca"<="" be="" p="" would=""> <p>If <code>multi.types</code> is a character vector, then it should be of the same length as the number of columns in <code>input.catalog</code>, and each value is the name of the tumor type of the corresponding column in <code>input.catalog</code>. e.g. <code>c("SA.Syn.Ovary-AdenoCA", "SA.Syn.Kidney-RCC")</code>.</p> </s.500"></p>
<code>verbose</code>	If <code>TRUE</code> then message progress information.
<code>gamma.alpha</code>	Shape parameter of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.
<code>gamma.beta</code>	Inverse scale parameter (rate parameter) of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.

### Value

Invisibly, an `hdpState-class` object as returned from `dp_activate`.

---

SetupAndPosterior    *Generate an HDP Gibbs sampling chain from a spectra catalog.*

---

### Description

Generate an HDP Gibbs sampling chain from a spectra catalog.

### Usage

```
SetupAndPosterior(
  input.catalog,
  seedNumber = 1,
  K.guess,
  multi.types = FALSE,
  verbose = TRUE,
  post.burnin = 4000,
  post.n = 50,
  post.space = 50,
  post.cpiter = 3,
  post.verbosity = 0,
  gamma.alpha = 1,
  gamma.beta = 1
)
```

**Arguments**

<code>input.catalog</code>	Input spectra catalog as a matrix or in <a href="#">ICAMS</a> format.
<code>seedNumber</code>	A random seeds passed to <a href="#">dp_activate</a> .
<code>K.guess</code>	Suggested initial value of the number of signatures, passed to <a href="#">dp_activate</a> as <code>initcc</code> .
<code>multi.types</code>	A logical scalar or a character vector. If <code>FALSE</code> , The HDP analysis will regard all input spectra as one tumor type. If <code>TRUE</code> , the HDP analysis will infer tumor types based on the string before ":" in their names. e.g. tumor type for "SA.Syn.Ovary-AdenoCA::S.500" would be "SA.Syn.Ovary-AdenoCA" If <code>multi.types</code> is a character vector, then it should be of the same length as the number of columns in <code>input.catalog</code> , and each value is the name of the tumor type of the corresponding column in <code>input.catalog</code> . e.g. <code>c("SA.Syn.Ovary-AdenoCA", "SA.Syn.Kidney-RCC")</code> .
<code>verbose</code>	If <code>TRUE</code> then message progress information.
<code>post.burnin</code>	Pass to <a href="#">hdp_posterior</a> burnin.
<code>post.n</code>	Pass to <a href="#">hdp_posterior</a> n.
<code>post.space</code>	Pass to <a href="#">hdp_posterior</a> space.
<code>post.cpiter</code>	Pass to <a href="#">hdp_posterior</a> cpiter.
<code>post.verbosity</code>	Pass to <a href="#">hdp_posterior</a> verbosity.
<code>gamma.alpha</code>	Shape parameter of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.
<code>gamma.beta</code>	Inverse scale parameter (rate parameter) of gamma distribution from which the Dirichlet process concentration parameters are drawn; in this function the gamma distributions for all Dirichlet processes are the same.

**Value**

Invisibly, an [hdpSampleChain-class](#) object as returned from [hdp\\_posterior](#).

---

SortExp	<i>Sort columns of an exposure matrix from largest to smaller (or vice versa).</i>
---------	--

---

**Description**

Sort columns of an exposure matrix from largest to smaller (or vice versa).

**Usage**

```
SortExp(exposures, decreasing = TRUE)
```

**Arguments**

<code>exposures</code>	The exposures to sort; columns are samples.
<code>decreasing</code>	If <code>TRUE</code> sort from largest to smallest.
